Lab - Network filter

Write a network filter for IPv4 – drop all packets to IP 192.168.0.2

- Declare a global nf_hook_ops
- Use nf_register_hook, nf_unregister_hook and write the hook main function
- In the hook function use ip_hdr to access the IP header and check the source address using in_aton
- Configure the kernel to support network filters
- Load the module and check using ping
